

Michigan Home Theatre's **Building a New Home**

News Brief

“You’re looking to build your dream home, and you don’t want to overlook anything!”

Building a New Home?

“You’re looking to build your dream home, and you don’t want to overlook anything!”

Some of your decisions will focus on design, while others will determine the functionality of your home. It’s exceedingly important that today’s decisions will allow you to adapt for future changes, especially as technology keeps evolving! If you’ve never thought about how your home should be wired for phone, TV, and technology, then now is the time to make those home wiring decisions – before it’s too late!

Low Voltage wiring, also known as infrastructure wiring, is the “spinal cord” of your home. It spans the spectrum from basic phone and cable TV wiring to the ultimate home automation system. Infrastructure wiring offers more than simply a telephone or cable outlet – it offers the flexibility that today’s new homes need to keep pace with advancing home technology. From sound to security, video to vacuum, lighting to laptops, the infrastructure wiring plan you implement in your new home will affect the functionality of your home for years to come.

You may want to consider consulting a professional to help you design and/or implement an infrastructure that will work for your home and your needs. Professionals can help you get a thorough “big picture” view of what you should consider in wiring your new home, and many will also help you select your systems and equipment to work with your specific needs.
